November 2019
STANDARD CONDITIONS 9-19: FARM NITROGEN AND PHOSPHORUS BUDGET

Under the Reef protection regulations, the following standard conditions for a farm nitrogen and phosphorus budget must be implemented and maintained for commercial sugarcane growing properties in the Great Barrier Reef catchment:

Standard condition 9
Sugarcane cultivation in any Great Barrier Reef catchment that requires an environmental authority for a prescribed ERA in schedule 2, section 13A of the Environmental Protection Regulation 2019 (new cropping and horticulture) must develop a Farm Nitrogen and Phosphorus Budget prior to fertilising the agricultural property.

Standard condition 10
From 1 December 2021, for the Wet Tropics, Burdekin and Mackay Whitsunday regions within the Great Barrier Reef catchment, a Farm Nitrogen and Phosphorus Budget must be developed prior to fertilising the agricultural property.

Standard condition 11
From 1 December 2022, for the Fitzroy and Burnett Mary regions within the Great Barrier Reef catchment, a Farm Nitrogen and Phosphorus Budget must be developed prior to fertilising the agricultural property.

Standard condition 12
A Farm Nitrogen and Phosphorus Budget developed for an agricultural property prior to the date it is required under standard condition 10 or standard condition 11 must be developed in accordance with standard condition 13-19.

Standard condition 13
The first Farm Nitrogen and Phosphorus Budget must be developed and verified by an appropriate person/s.

Standard condition 14
The Farm Nitrogen and Phosphorus Budget for the agricultural property must be reviewed and updated (in accordance with standard condition 15), at least annually by the person carrying out the agricultural ERA, and completed prior to fertilising.

Standard condition 15
A review and update of the Farm Nitrogen and Phosphorus Budget must include:

a) a recalculation of the whole of farm nitrogen amount for the following harvest period (in accordance with standard condition 7 and standard condition 17);

b) a recalculation of the whole of farm phosphorus amount (in accordance with standard condition 7 and standard condition 17);

c) an update to the farm map (in accordance with standard condition 17);

d) consider any other change(s) that may affect the amount of fertiliser calculated under standard condition 7 and standard condition 16.

Standard condition 16
The Farm Nitrogen and Phosphorus Budget for the agricultural property must be reviewed, updated and verified every five years by an appropriate person.

Standard condition 17
A Farm Nitrogen and Phosphorus Budget must be completed for the whole of farm and must include the following:

a) a farm map that includes:

(i) farm number or unique identifier/s,

(ii) block boundaries,

(iii) block identifiers,

(iv) area of each block (in hectares),
b) identification of physical or soil chemical constraints to yield (if they exist) for each management zone and/or blocks;

c) soil tests and analysis undertaken in accordance with standard condition 6;

d) nitrogen fertiliser rates calculated in accordance with standard condition 7 for each plant block and ratoon block for the following harvest period;

e) calculation of the whole of farm nitrogen amount for the following harvest period;

f) phosphorus fertiliser rates calculated in accordance with standard condition 7 for each plant block and ratoon block for the following harvest period or for the whole crop cycle;

g) calculation of the whole of farm phosphorus amount for the following harvest period or for the whole crop cycle;

h) name(s) and contact details of the appropriate person who developed and/or verified the Farm Nitrogen and Phosphorus Budget/s for the agricultural property.

**Standard condition 18**

The application rate of fertiliser applied to the agricultural property must not exceed the whole-of-farm nitrogen amount calculated under standard condition 17, except where the average farm yields over the last 15 years exceeded the maximum rate/district yield potential in at least 3 of those last 15 years (which must be demonstrated through verifiable yield records or other reasonable evidence from the past 15 years to the satisfaction of the administering authority).

**Standard condition 19**

The application rates of nitrogen and phosphorus fertiliser calculated for the agricultural property in accordance with standard condition 7 for individual blocks and/or management zones, can be exceeded only where:

a) a Farm Nitrogen and Phosphorus Budget has been developed for the agricultural property in accordance with standard condition 13-19; and

b) the higher rate(s) is offset by lower rate(s) on blocks or management zones elsewhere within the whole of farm so that the whole of farm amount of nitrogen and whole of farm amount of phosphorus are not exceeded.
Glossary

Activity: The environmentally relevant activity (ERA) to which this agricultural ERA standard applies.

Appropriate person: Means a person who has professional qualifications, training or skills or experience relevant to completing a Farm Nitrogen and Phosphorus Budget. This must include the ability to give an authoritative assessment, advice and analysis relevant to the farm, block and/or management zone, using protocols, standards, methods or literature, where relevant.

A grower can be considered an appropriate person if they demonstrate they have the appropriate skills, qualifications, or experience to complete the Farm Nitrogen and Phosphorus Budget acquired through a recognised program endorsed by the Department of Environment and Science (department).

Authorised person: Means a person appointed as an authorised person under the Environmental Protection Act 1994 by the chief executive or chief executive officer of a local government.

Block: An area of land that is typically used to grow sugarcane.

Commercial: For the purposes of this standard, commercial is defined as having an Australian Business Number (ABN) for the activity.

Constraint: Means something that affects productivity and yield. Also known as a limiting factor.

Crop cycle: For the purposes of this methodology a crop cycle is one plant and four ratoon crops.

Crop cycle phosphorus amount: Means the total amount of phosphorus that can be applied over a full crop cycle (five years).

District yield potential: Means yield potential for a sugarcane growing district as per the regulated method (refer to the ‘Prescribed Methodology for Sugarcane’).

Fallow: An area of land that is typically used to grow sugarcane, and that is left with either grass/weedy cover, green manure or a leguminous crop (i.e. crop or ground cover with low or no nitrogen demand) for a period of at least six months.

Farm Nitrogen and Phosphorus Budget: Is the farm map and any other documents (including records, fertiliser recommendations, and soil test results) used to prepare the Farm Nitrogen and Phosphorus Budget.

Fertiliser: Means a product that contains a quantified amount, obtained by analysis, of nitrogen and/or phosphorus.

Great Barrier Reef catchment: Has the same meaning as in the Environmental Protection Act 1994. The Great Barrier Reef catchment is the area shown on a map prescribed by regulation as the Great Barrier Reef catchment.

Management zone: For the purpose of this standard, means a block, or groups of blocks, with the same or similar yields and management history. Zones are defined in conjunction with an appropriate person by identifying areas based on fertiliser recommendations using soil test results, soil type and/or advice from the appropriate person.

Mill ash: Means a by-product produced by sugar mill boilers. Also known as boiler ash.

Mill by-product: Mill mud and mud/ash mixes.

Mill mud: Means the residual mud and fibre filtered from the raw sugar juice during the sugar refining process. Also called filter mud, filter cake or sugarcane press mud.

Plant crop: For the purposes of this standard means the initial sugarcane crop after planting.

Ratoon crop: For the purposes of this standard means a new crop of sugarcane that regrows from the portion of stalk left underground after harvesting of the previous crop.
Relevant primary document: Means a document relating to the carrying out of the activity that is the subject of the record from which information in the record was obtained; and includes:

a) receipts and invoices for the purchase of a chemical or fertiliser product;
b) a summary of tailored advice about carrying out the agricultural ERA (e.g. recommended application rates and frequency); and
c) a fertiliser or mill mud/mill ash invoice showing the product, amounts, and date(s) of delivery;
d) a soil test report which shows the results of soil testing and any nutrient recommendations made;
e) a contractor receipt which shows the amounts and locations of fertiliser products applied;
f) a fertiliser product bag tag or other information which shows the percentage of nitrogen and phosphorus.

Soil conditioner/s: Means a substance added to soil to improve the growing conditions for plant roots. Examples are gypsum, lime and organic matter. For the purpose of this standard, mill mud and mill ash are also considered soil conditioners.

Soil testing: Means a test of the characteristics of soil, analysed by a National Association of Testing Authorities (NATA) or Australasian Soil and Plant Analysis Council (ASPAC) accredited laboratory, or one holding an equivalent certification.

Sugarcane growing district: Means a sugarcane growing district as per the regulated method under standard condition 7 (refer to the Prescribed Method for Sugarcane).

Whole crop cycle: A period of five years (one plant and four ratoons).

Whole of farm: Means the area to which the Farm Nitrogen and Phosphorus Budget applies where:

a) the activity is carried out under the day-to-day management of a single responsible individual, for example, a site or operations manager;
b) the activity is operationally interrelated;
c) the activity is, or will be, carried out at one or more places;
d) places where the activities are carried out are separated by distances short enough to make feasible the integrated day-to-day management of the activities;
e) the activity is carried out within the same sugarcane growing district as per the Prescribed Method for Sugarcane.

Whole of farm nitrogen amount: Means the total amount of nitrogen fertiliser (sum of each block calculated using the Prescribed Method for Sugarcane) for the whole of farm for a 12 month period.

Whole of farm phosphorus amount: Means the total amount of phosphorus fertiliser (sum of each block calculated using the Prescribed Method for Sugarcane) for the whole of farm for an annual period or for a period of five years.
Introduction
The Environmental Protection Act 1994 requires commercial beef graziers, sugarcane growers, banana growers and horticulture and grain growers in the Wet Tropics, Burdekin, Mackay Whitsunday, Fitzroy and Burnett Mary regions of the Great Barrier Reef catchment to comply with commodity-specific minimum practice agricultural standards under the Reef protection regulations.

The purpose of the Reef protection regulations is to protect the health of the Great Barrier Reef by reducing pollutant run-off (nutrients, sediment and pesticides) in waterways that flow to the Reef.

The regulated minimum practice agricultural standards are based on the best available science and agricultural industry expertise to deliver significant water quality benefits for the Reef while driving better land management practices for profitable and productive farming.

The explanatory information in this document is to be used by growers, and others involved in providing advice on developing a Farm Nitrogen and Phosphorus budget.

The Great Barrier Reef catchment consists of the Cape York, Wet Tropics, Burdekin, Mackay Whitsunday, Fitzroy and Burnett Mary regions (Figure 1).

Producers in Cape York are not currently required to meet minimum practice agricultural standards as the region has met its Reef water quality targets (under the Reef 2050 Water Quality Improvement Plan 2017-2022).

You can find out if your property is in one of these regions by completing this online form available at www.qld.gov.au/ReefRegulations.

The online form gives you the number of hectares of your Lot/s in each Reef catchment. If a Lot on plan (i.e. the boundaries of your property) crosses the outer boundary of the Great Barrier Reef catchment, the Lot is considered within the Reef catchment if more than 75 percent of the Lot, or more than 20,000 hectares of the Lot, is within the Reef catchment boundary. If a Lot is located across the boundary of two Reef regions, the Lot is taken to be in the region where more than 50 percent of the Lot is located.
Introduction

The Environmental Protection Act 1994 requires commercial beef graziers, sugarcane growers, banana growers and horticulture and grain growers in the Wet Tropics, Burdekin, Mackay Whitsunday, Fitzroy and Burnett Mary regions of the Great Barrier Reef catchment to comply with commodity-specific minimum practice agricultural standards under the Reef protection regulations.

The purpose of the Reef protection regulations is to protect the health of the Great Barrier Reef by reducing pollutant run-off (nutrients, sediment and pesticides) in waterways that flow to the Reef. The regulated minimum practice agricultural standards are based on the best available science and agricultural industry expertise to deliver significant water quality benefits for the Reef while driving better land management practices for profitable and productive farming.

The explanatory information in this document is to be used by growers, and others involved in providing advice on developing a Farm Nitrogen and Phosphorus Budget.

The Great Barrier Reef catchment consists of the Cape York, Wet Tropics, Burdekin, Mackay Whitsunday, Fitzroy and Burnett Mary regions (Figure 1).

Producers in Cape York are not currently required to meet minimum practice agricultural standards as the region has met its Reef water quality targets (under the Reef 2050 Water Quality Improvement Plan 2017-2022).

You can find out if your property is in one of these regions by completing this online form available at www.qld.gov.au/ReefRegulations.

The online form gives you the number of hectares of your Lot/s in each Reef catchment. If a Lot on plan (i.e. the boundaries of your property) crosses the outer boundary of the Great Barrier Reef catchment, the Lot is considered within the Reef catchment if more than 75 percent of the Lot, or more than 20,000 hectares of the Lot, is within the Reef catchment boundary. If a Lot is located across the boundary of two Reef regions, the Lot is taken to be in the region where more than 50 percent of the Lot is located.

Figure 1: The Great Barrier Reef stretches more than 2,300 kilometres along Queensland’s coastline. It receives run-off from 35 catchments which are spread over six natural resource management regions.
Purpose of this guide

The purpose of this document is to provide practical information to enable you to comply with the standard conditions for developing a Farm Nitrogen and Phosphorus Budget (N&P Budget) for your farm in accordance with the Agricultural ERA standard for sugarcane cultivation – version 1 under the Environmental Protection Act 1994.

The intent of the N&P Budget is to encourage and assist growers to identify and address constraints to productivity, and to review and refine their nitrogen and phosphorus management at a finer scale. This should lead to improved nutrient use efficiency, improving production and profitability, whilst reducing the amount of surplus nitrogen and phosphorus that could be lost from the farm.

The N&P Budget supports you to calculate nitrogen and phosphorus rates for each block or management zone on your farm using the Prescribed methodology for sugarcane cultivation. It can be used to document measures used to ameliorate or manage constraints, as well as your farm fertiliser program, soil nutrient status and yield.

Although only nitrogen and phosphorus are regulated through an N&P Budget, you are encouraged to incorporate these requirements into a more comprehensive nutrition management plan, to look at other aspects of your farming that can help ensure your crop receives optimum nutrition to achieve its yield potential.

Regulations timeframe for commercial sugarcane growing

The Reef protection regulations apply to different regions at different times. Please refer to the table below for the timeframes for commercial sugarcane growing.

<table>
<thead>
<tr>

</tbody>
</table>

*This means that the N&P Budget will be prepared to cover fertiliser rates for the following harvest period in 2022 (for Wet Tropics, Burdekin and Mackay Whitsunday) and for the following harvest period in 2023 (for Burnett Mary and Fitzroy).
What do I need to do?
Before undertaking an N&P Budget you should seek professional advice from an appropriate person – see the Contacts section for more information.

There are a number of stages associated with the N&P Budget, which are outlined below.

Stage 1. Develop a farm map
Develop a farm map/s clearly showing block boundaries, block identifiers, area of each block (ha).

Stage 2. Soil testing
Use the regulated method for soil sampling.

Stage 3. Identify management zones
Define and mark management zones and crop constraints that may exist on the farm map, and attach or overlay the soil type map.

Stage 4. Working out how much nitrogen and phosphorus to apply
Use the regulated method to calculate nitrogen and phosphorus rates and the whole of farm amount of nitrogen and phosphorus.

Stage 5. Review and Update
Annual review of N&P Budget taking into account on-farm changes.

Stage 6. Varying rates within your farm
Advice on varying the application rates of nitrogen and/or phosphorus across your farm taking into account the farm’s specific circumstances.

You can find more detail on each stage in the following sections.
Development of the farm N&P Budget

Your first N&P Budget must be developed and verified by an appropriate person (this can be either the same or a different appropriate person/s). You must then review and update the N&P Budget for your farm at least annually prior to fertilising. It must be developed prior to fertiliser being applied to the farm each year. You can amend your N&P Budget at any time, as long as the annual review is completed at least every 12 months. Every five years, the N&P Budget must be reviewed, updated and verified by an appropriate person. An Example layout for an N&P Budget is provided on page 16.

Record keeping requirements

To comply with Reef regulations, you must keep a copy of your N&P Budget for at least six years and make it available for inspection to an authorised person on request. Records must be made within three business days. Records can be kept in any form, but must contain the following information as a minimum:

1. Calculated whole of farm nitrogen amount for the following harvest period (kg)
2. Calculated whole of farm phosphorus amount for the following harvest period (kg) or
3. Annual amount of nitrogen applied to the whole of farm for the previous harvest period (kg)
4. Annual amount of phosphorus applied to the whole of farm for the previous harvest period (kg) or record of blocks/management zones where the crop cycle phosphorus amount is being applied
5. Actual yield achieved for the previous harvest period (tonnes/cane/ha)
6. Historical yields (if applicable to meeting Standard condition 18) (tonnes/cane/ha)
7. A farm map, including:
   a. farm number or unique identifier/s
   b. block boundaries
   c. block identifiers
   d. area of each block (in hectares)
   e. area of whole of farm (in hectares)
   f. crop class and fallow areas
   g. identification of any physical or soil chemical constraints to yield (if they exist) for each management zones and/or blocks
8. Name(s) and contact details of the appropriate person who developed and/or verified the N&P Budget for the agricultural property
9. Date the N&P Budget was developed and verified.

The actual documents that relate to the record (for example soil test reports, fertiliser contractor print-outs, or fertiliser invoices) are relevant primary documents that provide proof of the records and must also be kept.

Stage 1: Develop a farm map

Your N&P Budget must include a farm map (see Figure 2 as an example) for your property that includes the following information:

- farm number or unique identifier/s
- block boundaries
- block identifiers
- area of each block (in hectares)
- area of whole farm (in hectares)
- crop class (e.g. plant, first ratoon, second ratoon)
- management zone boundaries (if management zones have been defined for your farm – see Stage 3 Management zones).
Stage 2: Soil testing

Use the regulated method for soil sampling

The fertiliser recommendations in your N&P Budget must be based on soil testing and analysis that has been carried out using the latest version of the Prescribed methodology for sugarcane cultivation, available online at www.qld.gov.au/ReefRegulations.

You must be able to reference soil test records for each block of cane to be fertilised*. You should use the recommendations in your soil test results as the starting point for your N&P Budget. These fertiliser rates may then change depending on whether, for example, constraints have been identified and adjusting rates are used as a management technique.

Soil testing should include a full range of nutrients, not just nitrogen and phosphorus, to ensure that the crops full nutritional needs are met.

*If you grow cane in the Burnett Mary and Fitzroy regions, you may wish to voluntarily develop an N&P Budget prior to 1 December 2022.

For the Burnett Mary District:

- If you do not have soil test results for some ratoon blocks/management zones, you should calculate your whole of farm amount with application rates at or below the baseline application rate for the Burnett Mary district as published in the Six Easy Steps, available online at www.sugarresearch.com.au. Plant cane crops and subsequent ratoons established after your N&P Budget is developed must have application rates calculated using the latest version of the Prescribed methodology for sugarcane cultivation.

For the Fitzroy District:

- As the Six Easy Steps has not defined a district yield potential for the Fitzroy region and the Prescribed methodology for sugarcane cultivation will not include district yield potentials for this region until 1 December 2022, growers in the Fitzroy should seek advice from an appropriate person to develop an interim yield potential – this may be the yield potential that is the closest match to your property in terms of factors such as region, climate and soil types. Once you have an interim yield potential you can use the same procedure outlined in the Prescribed methodology for sugarcane cultivation for plant cane crops and subsequent ratoon crops. Where no soil test results are available for existing ratoon blocks you should calculate your whole of farm amount with application rates at or below the baseline application rate corresponding to your interim yield potential. For example, if you have records showing blocks on your farm are yielding around 100 tonnes of cane per hectare, then 100 is multiplied by 1.2 to give you an interim yield potential of 120 tonnes per hectare, and your baseline nitrogen application rate is 160 kg nitrogen per hectare.

Record keeping requirements for soil testing are:

- Date of soil testing and a description of the location and the dominant soil type sampled.
- Map of the boundaries of blocks or management zones where:
  - Soil sampling has been undertaken; and
  - Where fertiliser and mill by-products have been applied.
- A soil map showing the dominant soil types covering the blocks or management zones where samples were taken (see Figure 3 as an example of how you can record your soil types on your farm map).

You can use any format to keep your records, for example computer-based or paper-based. You can access forms for record keeping in Attachment 1 of the Prescribed methodology for sugarcane cultivation.
Stage 3: Management zones

Step 3.1 Identify crop constraints

Your farm may have underlying constraints (also known as limiting factors) to the crops yield potential. These may include, but are not limited to, soils that are frequently waterlogged, highly sodic or severely compacted. Other considerations, for example different varieties, may also affect yield potential. Constraints such as these may provide opportunities to refine nutrient rates.

Under the minimum standards, an appropriate person must identify these areas of constraint on your N&P Budget (Figure 3). Addressing these constraints is not a mandatory requirement, however the appropriate person should provide recommendations to address the constraint or recommend refined nutrient application rates that better align with the crops capacity to use the applied nutrients. In some areas nutrients may be available through sources other than fertiliser, such as from legume crops, composted manure, or nitrogen in irrigation water, which should be taken into account. Your N&P Budget can be used to adjust fertiliser rates for each block as long as the whole of farm amount is not exceeded (see Step 4.2 Work out the Whole of Farm Amount).

Measures for responding to constraints and improving nutrient use efficiency might include:

- ameliorants or organics;
- drainage works
- improving soil health
- introducing new varieties
- fallow management
- applying nitrogen and phosphorus rates lower than the rate calculated under Stage 4: Work out how much nitrogen and phosphorus to apply, for any specific blocks and/or management zones.

Step 3.2 Define management zones

Based on your farm map and identification of constraints, you should work out, with the help of an appropriate person, if management zones can be defined across your property. As a minimum, if your soil sampling plan uses a representative block to describe a number of blocks to be planted, this group of blocks could be regarded as a single management zone. Other considerations include:

- irrigation availability
- areas where soil conditioners have been previously applied
- a group of blocks with the same or similar average yield over several crop cycles and the same or similar management history.

If you define management zones for your farm, you should mark them on your farm map (see Figure 4 as an example).

Stage 4: Work out how much nitrogen and phosphorus to apply

Step 4.1 Calculate nitrogen and phosphorus rates

Using the Prescribed methodology for sugarcane cultivation, use your soil test results for each block to calculate the regulated amounts of nitrogen and phosphorus to apply (see Table 1). These amounts will be provided to you as part of your soil test result.

Record keeping requirements

You are required to keep a record of fertiliser (nitrogen and phosphorus) recommendations for each block of cane. The recommendations may be kept in any format as long as they can be referenced to each block on your farm map. For example, you may choose to record your fertiliser recommendations in an electronic spreadsheet with a column showing the block number the recommendation applies to.
Step 4.2 Work out the Whole of Farm Amount

Once you have your recommendations for each block, an appropriate person can develop your N&P Budget by summing the regulated amounts of nitrogen and phosphorus for each block to define the whole of farm amount (see Table 2) by:

- adding together the calculated amount of nitrogen for each block to get your whole of farm nitrogen amount for the year and
- adding together the calculated amount of phosphorus for each block to get your whole of farm phosphorus amount for the year or
- clearly identifying blocks where you are applying phosphorus at rates higher than the annual allowance but do not exceed the amount calculated for the crop cycle (five years), i.e. one plant plus four ratoons. If you choose to use the **crop cycle phosphorus amount** method across some blocks or the whole farm (see Table 2), remove these areas from the whole of farm budget and consider them separately.

The appropriate person will use this information to determine fertiliser products to apply and refinements to application if applicable. The N&P Budget does not necessarily require different products for each management zone or block.

Stage 5 Review and update your N&P Budget

Each year, your sugarcane N&P Budget must be reviewed and updated, taking into account:

- soil testing and analysis results for the blocks to be planted in that year
- changes due to crop class and fallow area
- any other change made to your property that affects the amount calculated under Stage 4: Work out how much nitrogen and phosphorus to apply. Changes could include blocks that have been ploughed out earlier than expected, standover cane due to adverse weather conditions, or other circumstances
- annual recalculation of the whole of farm amounts for nitrogen and phosphorus to reflect the above changes.

You can review and adjust the N&P Budget yourself or choose to engage an appropriate person to do the update for you. After five years, your N&P Budget must be reviewed and verified by an appropriate person.

Each year you must:

- re-calculate and add together the calculated amount of nitrogen for each block to get the whole of farm nitrogen amount that can be applied in the coming season; and
- re-calculate and add together the calculated amount of phosphorus for each block to get the whole of farm phosphorus amount that can be applied in the coming season, or
- record your phosphorus applications that do not exceed the crop cycle requirement.

These calculations must use the block areas defined on your farm map. You may wish to engage an appropriate person to help you with updating the calculations. The N&P Budget can be amended at any time to take account of unforeseen farm management changes due to, for example, extreme weather, however the whole of farm amount must be equal to or less than the combined calculated amounts worked out using the two components of the *[Prescribed Methodology for Sugarcane cultivation](#)*.

**Note:** where you have applied the calculated amount of phosphorus for the whole crop cycle, these blocks should be removed from the whole of farm amount calculation and recorded separately.

Stage 6 Varying rates within your farm

Based on the recommendations from an appropriate person, you may wish to vary the application rates of nitrogen and/or phosphorus across your farm, taking into account the farms specific circumstances. You may do this under an N&P Budget, but must ensure that you do not exceed the whole of farm amount. The appropriate person may recommend making deductions for a combination of situations, for example nitrogen available through a legume fallow crop and an agronomic
assessment of crop nitrogen requirements taking into account current understanding. See Tables 5 and 9 for an example of varying rates across a farm.

You have now completed all steps required to develop, review and update an N&P Budget for your farm. It is important that you work through these steps with an appropriate person.

**Example layout for an N&P Budget**

This section provides an example layout for completing and recording an N&P Budget. This approach is not compulsory and you can choose to use your own method, as long as it meets all of the requirements of the regulated minimum standards, including use of the soil testing method and nutrient calculation method contained in the *Prescribed methodology for sugarcane cultivation*.

See the **Contacts** section for organisations that can provide further advice.

**Stage 1: Develop your farm map**

![Farm map example](image)

**Figure 2**: Example of a farm map for a mock property showing farm number, whole farm area, block boundaries and areas, and crop stage.

**Stage 2: Soil testing**

Table 1 provides an example that allows cross referencing of the farm map, soil sampling results, and nutrient recommendations that may be provided with your soil test report.
Table 1: Example of fertiliser recommendations provided from soil testing results. Each block can be referenced to a soil test.

Stage 3: Define areas of crop constraints and management zones
Once you have defined any areas of crop constraints, you should mark these on your farm map. Figure 3 shows an example of how you might do this.

Figure 3: Example of a farm map for a mock property showing a hypothetical area of constraint (shown as the blue area).

If you decide that it is appropriate to define management zones for your property, you should also mark these on your farm map. See Figure 4 for an example.
Figure 4: Example of a farm map for a mock property showing management zones and dominant soil types.

Stage 4: Work out the whole of farm amount
Table 2 provides an example of a whole of farm amount calculation taken from the hypothetical values presented in Figure 4 and Table 1, for the first year of the N&P Budget.

Table 2: Nitrogen and phosphorus recommendations for each management zone, and whole of farm amount in 2018 (year one).

Stage 5: Review and update your N&P Budget
Table 3 provides an example of updated nitrogen and phosphorus recommendations based on new soil test results for plant blocks and changes to the crop cycle stages, to create a new whole of farm amount for nitrogen and phosphorus for year two. This process will reflect the rotation of crops across your property, for example the progression on a specific block from plant through ratoon crops.

Whole of Farm amount 22.5 2845 No whole of farm P amount

Stage 6: Varying rates within your farm
As an example, in year three you may wish to vary the fertiliser rates across your farm. Table 4 represents an update of the hypothetical values presented in Tables 2 and 3 into year three of the N&P Budget (determined using Step 4.1 Calculate nitrogen and phosphorus rates) where the Prescribed Methodology for Sugarcane Cultivation has been used to calculate the application rates for specific blocks and management zones to determine the whole of farm amount.

Table 4: Updated nitrogen and phosphorus rates as defined by the regulated method, and whole of farm amount for year three.

Table 5 provides an example of how the rates determined using Step 4.1 (the Prescribed methodology for sugarcane cultivation) can be varied whilst not exceeding the whole of farm amount.
In this example the appropriate person recommended making deductions for a combination of situations, i.e. nitrogen available through a legume fallow crop and an agronomic assessment of crop nitrogen requirements taking into account current understanding.

Table 5 shows a higher application rate of nitrogen being applied to zone one (increase in yield potential) that is offset with lower applications of nitrogen being applied to zones two (nitrogen available from fallow legume crop) and three (lower nitrogen demand according to agronomic understanding). The combined rates as a result of these adjustments do not exceed the whole of farm amount of nitrogen and phosphorus.

Table 5: Example of how nitrogen rates can be varied within the N&P budget. Red text shows the varied N rates; the blue shaded columns show the original and varied N amount per management zone.

Managing the whole of farm phosphorus amount
The example above focused on a calculation of the whole of farm amount for nitrogen and used the crop cycle phosphorus amount as described in the Prescribed methodology for sugarcane cultivation (see Option 1 below).

However you can use the whole of farm phosphorus amount and vary rates across your farm if you choose. Therefore there are two options available to you to manage your phosphorus applications:

Option 1
If you use the crop cycle phosphorus amount – there is no need to work out a whole of farm amount of phosphorus in your N&P Budget, but you must still record phosphorus rates for given blocks.

Example crop cycle amount

<table>
<thead>
<tr>
<th>Region</th>
<th>Herbert</th>
</tr>
</thead>
<tbody>
<tr>
<td>BSES P</td>
<td>45 mg/kg</td>
</tr>
<tr>
<td>PBI</td>
<td>290 (High sorption class)</td>
</tr>
<tr>
<td>Plant amount</td>
<td>20 kg/ha P x 1 year</td>
</tr>
<tr>
<td>Ratoon amount</td>
<td>10 kg/ha P x 4 years</td>
</tr>
<tr>
<td>Crop cycle amount</td>
<td>60 kg/ha P (applied at plant and covering 5 years)</td>
</tr>
</tbody>
</table>
In this example the appropriate person recommended making deductions for a combination of situations, i.e. nitrogen available through a legume fallow crop and an agronomic assessment of crop nitrogen requirements taking into account current understanding.

Table 5 shows a higher application rate of nitrogen being applied to zone one (increase in yield potential) that is offset with lower applications of nitrogen being applied to zones two (nitrogen available from fallow legume crop) and three (lower nitrogen demand according to agronomic understanding). The combined rates as a result of these adjustments do not exceed the whole of farm amount of nitrogen and phosphorus.

Table 5: Example of how nitrogen rates can be varied within the N&P budget. Red text shows the varied N rates; the blue shaded columns show the original and varied N amount per management zone.

Managing the whole of farm phosphorus amount

The example above focused on a calculation of the whole of farm amount for nitrogen and used the crop cycle phosphorus amount as described in the Prescribed methodology for sugarcane cultivation (see Option 1 below). However you can use the whole of farm phosphorus amount and vary rates across your farm if you choose. Therefore there are two options available to you to manage your phosphorus applications:

Option 1
If you use the crop cycle phosphorus amount – there is no need to work out a whole of farm amount of phosphorus in your N&P Budget, but you must still record phosphorus rates for given blocks.

Example crop cycle amount

- Region: Herbert
- BSES P 45 mg/kg PBI 290 (High sorption class)
- Plant amount: 20 kg/ha P x 1 year
- Ratoon amount: 10 kg/ha P x 4 years
- Crop cycle amount: 60 kg/ha P (applied at plant and covering 5 years)

OR

Option 2
If you apply your phosphorus annually, you can then work out the whole of farm phosphorus amount in your N&P Budget by adding together the calculated amount of phosphorus for each block/management zone to get your whole of farm phosphorus amount for the year, see Step 4.2 Work out the Whole of Farm Amount.

The following is another hypothetical example used to illustrate an acceptable procedure for working out the whole of farm phosphorus amount and varying phosphorus rates while ensuring you do not exceed the whole of farm phosphorus amount. Table 6 provides an example of a whole of farm amount calculation for the first year of the N&P Budget.

Table 6: Nitrogen and phosphorus recommendations for each management zone, and whole of farm phosphorus amount in 2018 (year one).
